

# SUNRISE

## Filtration System FC-1 Portable Series

Filtration is the key element in maintaining an efficient hydraulic system. The FC-1 help you to Save Time, Labor and Maintenance Cost

### Filter Elements:

- The SUNRISE filtration system uses two separate filters. Fluid passes through one filter for a general cleaning, and then through the other filter for the ultrafine particles.
- The first filter uses wire elements which can be washed and reused. The second filter, which is replaceable, has a large capacity for holding dirt.

### Filter Pump:

- The filter system uses a 40 liter per minute gear pump. The high capacity reduces the time needed for filtration, and improves the quality of the job.
- The system can be used as an oil transfer pump for filling and draining oil from/to hydraulic systems.
